Main Page

The project name **「Tsubame」** is the Japanese word for swallow. The natural habitat of Tsubame range widely in the Asia Pacific, and migrate from region to region. This migrant characteristic and the fact that they look down at the ground from the sky, are very similar to the project, which observes Internet scan activities throughout the Asia Pacific region. Furthermore, Tsubame has also been popular in Japan from a long time ago among the public, as a useful bird that eat insect pests.
